DESCRIPTION:

Since the very first stages of its professionalization the history of science has been seen as a bridge between the “two cultures”, the natural sciences and the humanities. Over the years, one part of this triadic complex, the relations between the history of science and the natural sciences, has been extensively discussed. The relations between the history of science and the humanities, however, have been less commented upon. The aim of this workshop is to further elaborate these latter relations: First, by discussing how history of science fits within the rich landscape of the humanities, which have themselves been facing various challenges and opportunities. Second, by reflecting on how history of science, and the humanities more generally, can be brought to bear on wider and socially relevant issues, such as the digital condition, the rise of fake news, post-truth, and science denialism.
